Once installed, you will be able to access all the local files and folders on your computer. Adobe Lightroom Classic 5. Evaluation of plasmid transformation of sorghum for use in transgenic studies. Transformation of sorghum is complicated due to the large size of the genome and the presence of

polyploidy in the species. Here, we report the generation of a sorghum transformation plasmid, pUCC28, to be used for the transformation of the xa-3 sorghum cultivar. This plasmid contains the vector pUCC23, which comprises the CaMV 35S promoter and 35S terminator, the left and right borders from the Ti plasmid of Agrobacterium tumefaciens, and the herbicide resistance gene phosphinothricin acetyl transferase (bar) under the control of the double enhancer from the PDK

promoter and 35S terminator. The 35S promoter and 35S terminator sequences from pUCC23 were replaced with the CaMV 35S promoter and 35S terminator. To complete the vector, a fusion of the right border and the A. tumefaciens left border was excised from the agropinecontaining vector pGPT2 and introduced into the pUCC23 vector. The resulting vector, pUCC28, was shown to confer > 2.5-fold resistance to the plant growth regulator bialaphos (0.8)

mg/L). The proposed St. Louisbased waste-to-energy plant, which would be designed to burn plastics and wood scraps, would become the first in the U.S. to burn plastic made from reclaimed food and beverage containers. If built, the plant would create more than a million tons of methane annually, which the company says would offset the electricity produced by burning 60,000 barrels of oil annually. At the same time, it would reduce greenhouse gas emissions by up to 1.5 million tons

per year and generate 25 percent of the electricity in the city of St. Louis, organizers say. The \$1.2 billion plant, if built, would be similar to one already planned for Hawaii's Honolulu suburb of Waimanalo, although that plant will burn mixed plastics and liquid waste (f678ea9f9e
